Hydrating and providing

Registering a hydrater

Lib

To create a hydrater, you can `POST /hydraters` with your hydrater data; for instance:

```
{
  shortName: 'markdown',
  description: 'AnyFetch Hydrater for markdown files.',
  url: 'https://markdown.anyfetch.com/hydrate',
  excludes: ['https://plaintext.anyfetch.com/hydrate'],
  filters: [
    {
      metadata : {
        path: /\. (md|mkd|markdown)$/i,
      },
      documentType: {
        name: 'file'
      },
      filePath: /^./
    },
  ]
}
```

Lib

Here at AnyFetch, we use Node.js for our hydraters to improve latency and hydrate multiple files at once. You can use the [AnyFetch](#) library from npm, or [AnyFetch Hydrater](#). You'll find additional documentation directly on those repos.
